Abstract

Hydroalcoholic extract and essential oil of aerial parts of *Pycnocycla caespitosa* have spasmolytic activity on rat ileum contractions. The objective of this research was to separate fractions of total hydroalcoholic extract of *P. caespitosa* guided by their spasmolytic activity on rat uterus. Aerial parts of *P. caespitosa* were extracted with ethanol. The concentrated extract was subjected to column chromatography and thin layer chromatography (TLC) for isolation fractions, then one of the bioactive fractions was subjected to further isolation to find its active components. Five fractions were obtained (Fr.1-Fr.5) and their anti-spasmodic activities were examined on uterus contraction induced by KCl (80 mM) and compared with ritodrine. In addition, spasmolytic effect of Fr.4 (one of the bioactive fractions) was determined on rat uterus induced by oxytocin (0.0005 IU/mL) and compared with ritodrine. Hydroalcoholic extract of *P. caespitosa* (0.032-2 mg/mL) reduced the responses to KCl but the inhibitory effect was not complete with 2 mg/mL extract in the bath. Four fractions (Fr.1, Fr.2, Fr.3 and Fr.4) (32-500 μg/mL) inhibited rat uterus contractions on the uterus while Fr.4 was slightly more active than others (IC₅₀ = 146 ± 23 μg/mL). Falcarindiol and isoacetovanillone were identified from Fr.4 using phytochemical methods including high-performance liquid chromatography (HPLC), nuclear magnetic resonance (NMR) and TLC. In conclusion, in this research bioactivity guided technique was successfully used for separation of active fraction of *P. caespitosa*. Falcarindiol and isoacetovanillone were identified from the active fraction which inhibited both tonic and rhythmic contractile responses in rat isolated uterus.

Keywords: Isoacetovanillone; Falcarindiol; *Pycnocycla caespitosa*; Uterus; Bioactivity; Anti-spasmodic

INTRODUCTION

*Pycnocycla caespitosa* Boiss. & Hausskn belongs to genus of *Pycnocycla*, subfamily of Umbellales and family of Umbelliferae (1). *Pycnocycla* contains eight different species in Iran from which *P. spinosa* phytochemistry and pharmacological properties is published by the same authors in previous researches (2-8). Hydroalcoholic extract of *P. spinosa* has shown spasmytic effect on ileum, uterus and bladder smooth muscles in vitro, antidiarrheal and spasmytic activity in vivo (6-9). Using a bioassay-guided isolation from aerial parts of *P. spinosa*, a new polycyclic diterpenoid, (3,7,10,14,15-pentaacetyl-5-butanoyl-13,17-epoxy-8-myrsinene), vanillin, isoacetovanillone, and a new phenolic compound, 6-(4-hydroxy-3-methoxyphenyl)-hexanoic acid with inhibitory effects on KCl-induced smooth muscle contractions on the rat were isolated (8-11). It is likely that other species of *Pycnocycla* have similar pharmacological activities like spasmytic effect on uterus. *P. caespitosa* naturally grows in some parts of Kohgiloye and Boyerahmad and Khozestan provinces of Iran (12).
In Tangesolakin Kohkiloyah and Boyerahmed this plant is known as BonjehKharo and its boiled extract is traditionally used as a drug for reducing dysmenorrhea. Its extract has anti-inflammatory and analgesic effects in animal model of inflammation and pain (13, 14). The main components of its essential oil were identified as carvacrol, β-eudesmol, ρ-cymene, caryophyllene oxide, α-pinine and α-phelandrene (15). The hydroalcoholic extract and essential oil of *P. caespitosa* inhibit ileum contraction induced by various spasmogens including acetylcholine, electrical field stimulation and KCl, in vitro (15). However, the hydroalcoholic extract of *P. caespitosa* is a mixture of unknown substances with different pharmacological activities. Therefore, it is essential the active substances that are relaxant of uterus smooth muscle be identified.

**MATERIALS AND METHODS**

**Drugs and solutions**

Solidified extract or fractions (Fr.1 – Fr.5) were weighed and prepared as 20 or 40 mg/mL stock solution in dimethyl sulfoxide (DMSO). Ritodrine (Spain; prepar®) was prepared as 10 mg/mL stock solution in distilled water. Further dilutions were made in distilled water. KCl was prepared as 2 M stock solution. Oxytocin ampule (Aburaihan Pharm., Iran) was prepared as 10 IU/mL stock solution and diluted to 1 IU/mL solution with distilled water. 17-β-estradiol was prepared as 100 μg/mL stock solution in edible oil. Tyrode's solution (NaCl: 136.9, KCl: 2.68, CaCl2: 1.8, MgCl2: 1.05, NaHCO3: 11.9, NaH2PO4: 0.42, and glucose: 5.55 (mM)), was prepared in distilled water. Unless stated, all the chemicals were purchased from Merck Company (Germany).

**Plant materials**

Aerial parts of *P. caespitosa* Boiss. & Hausskn (umbelliferae) were collected in June, 2015 from Gachsaran (Kohgiloye and Boyerahmad province, Iran). It was identified and compared with voucher specimen of the plant (No. 3042) deposited in the herbarium of the Faculty of Pharmacy and Pharmaceutical Sciences, Isfahan University of Medical Sciences, Iran.

**Extraction and fractionation**

Dried plant material (5 kg) was macerated with 40 L ethanol for three days and repeated three times at room temperature, and then concentrated under reduced pressure using a rotary evaporator. The yielded gummy extract was loaded on a vacuum liquid chromatography (VLC) charged with reverse silica-gel packed into a Büchner funnel with a sintered glass disc (150 × 90 mm) using MeOH: H2O as eluent. Washing VLC with MeOH: H2O (7:3) eluted a semi polar fraction (390 g light brown filtrate) and retained polar constituents. Defatted fraction was chromatographed on normal open column using gradient mixtures of hexane: acetone and yielded five fractions: Fr.1 (90:10); Fr.2 (85:15); Fr.3 (80:20); Fr.4 (70:30); Fr. 5 (0:100). Fractions were concentrated to dryness and stored at 0 °C until use.

**Uterine contractile assessment**

Experiments were conducted on adult non-pregnant female Wistar rats (180-250 g) bred in School of Pharmacy animal house. All animals were handled in compliance with the principles of the guide for care and use of laboratory animal care. A day before experiment, rats were pretreated with 17-β-estradiol (100 μg/kg, SC), and housed in cages with free access to food and water at room temperature. On the day of experiment, rats were killed by a blow on the head, followed by exsanguination. Both uterine horns were removed and placed in oxygenated Tyrode's solution at room temperature. The uterine horns were separated from each other. A section of uterine horn was mounted for isotonic contraction under 1 g tension in 20 mL organ bath (Harvard, England) containing Tyrode's solution and continuously gassed with O2 at 37 °C. Uterine contraction was measured using a Harvard isotonic transducer and recorded on a Harvard Universal Oscillograph (England) pen recorder device. The other uterine horn was used as vehicle treated time matched control tissue. After calibrating the oscillograph, 3 successive washes was given to the tissue and allowed to relax to a stable base line. Following a resting period of about 30 min, inhibitory effect of
Bioactive compounds from Pychnocycla caespitosa

P. caespitosa extract or fractions (Fr.1-Fr.5) were examined on isolated rat uterine contraction induced by KCl or oxytocin as described before (16) and compared with ritodrine as standard drug. All procedures were reviewed and approved by the university animal care committee.

Effect of drugs on spasm induced by potassium chloride

Uterine horns were exposed to KCl (80 mM) to induce tonic contraction. After 15 min equilibration time, drugs were added in a cumulative manner to the bath until maximum inhibition was obtained. The time matched control tissues were treated with equivalent volume of relaxant vehicle.

Effect of drugs on spasm induced by oxytocin

Rhythmic spasms of uterine were induced by adding oxytocin (0.0005 IU/mL) into the bath. After 5 min equilibration time, drugs were added to the bath in a cumulative manner until maximum inhibition was achieved. The time matched control tissues were treated with equivalent volume of relaxant vehicle.

Isolation of bioactive compounds

Relaxant effect of the resulted fractions: Fr.1 to Fr.5 were compared in vitro on KCl-induced contraction in rat uterus smooth muscles. The most bioactive fraction, Fr.4 was selected and subjected on a sepak RP-18 cartridge using methanol:water (7:3) as mobile phase to remove chlorophylls and fats. Defatted fraction was injected to high-performance liquid chromatography (HPLC) using YMC-Pak-Sil column (250 × 20 mm) and hexane/EtOAc (80:20) as mobile phase to yield compounds 1 and 2 as the major bioactive compounds.

Compound 1: pale oil. IR (NaCl) \(\nu_{max}\): 3354, 3024, 2964, 2939, 2860, 2360, 2254, 2152, 1647, 1560, 1468, 1419, 1379, 1304, 1269, 1120, 1020, 987, 933, 879 cm\(^{-1}\). \(1^H\)-NMR (CDCl \(_3\), 400 MHz, J in Hz): \(\delta_{H} 0.90 (3H, t, J = 6.8 Hz, H3-17), 1.29 (10H, m, H2-12, 13, 14, 15, 16), 2.01 (2H, q, J = 7.2 Hz, H2-11), 2.41 (2H, br s, 3-OH and 8-OH), 4.96 (1H, d, J = 4.8, H-3), 5.21 (1H, d, J = 8.0, H-8), 5.27 (1H, d, J = 16.8, H-1a), 5.53 (1H, dd, J = 9.2, 8.0, H-9), 5.64 (1H, dt, J = 9.2, 7.2, H-10), 5.97 (1H, ddd, J = 5.2, 10.0, 16.8 Hz, H-2). \(^{13}C\)-NMR (CDCl\(_3\), 100 MHz): \(\delta_{C}\)14.1 (C-17), 22.6 (C-16), 27.7 (C-15), 29.11, 29.16, 29.3 (C-12, C-13, C-14), 31.8 (C-11), 58.6 (C-8), 63.4 (C-3), 68.7 (C-5), 70.3 (C-6), 78.3 (C-4), 79.9 (C-7), 117.3 (C-1), 127.7 (C-10), 134.6 (C-9), 135.8 (C-2). EI-MS m/z 259 [M-H].

Compound 2: white solid; \(1^H\)-NMR (400 MHz, CDCl\(_3\)): \(1^H\)-NMR (400 MHz) 7.47 (2H, m, H-2, H-6), 6.88 (1H, d, J = 8.7, H-5), 3.89 (3H, s, 4-OMe), 2.49 (3H, s, 2'-Me); \(^{13}C\)-NMR (100 MHz, CDCl\(_3\)): 26.21 (C-2'), 56.08 (4-OMe), 109.69 (C-5), 113.75 (C-2), 124.02 (C-6), 130.24 (C-1), 146.60 (C-3), 150.39 (C-4), 196.83 (C-1'); EI-MS (m/z): 166 [M].

Data analysis

The contractile response to KCl and oxytocin were measured as maximum amplitude from pretreatment baseline and expressed as the percentage of the initial response in the absence of drugs or vehicle for each tissue. All the values are quoted as mean ± standard error of the mean (SEM). The IC\(_{50}\) value (drug concentration causing 50% of maximum response) of the relaxant uterus was calculated for each tissue and mean and SEM was determined for each group of results. Sigma plot computer program was used for statistical analysis and drawing the graphs for calculation of IC\(_{50}\) values.

RESULTS

Effects on KCl-induced smooth muscle contraction in rat uterine

KCl (80 mM) caused a sustained tonic contraction which maintained for the duration of study. The hydroalcoholic extract of P. caespitosa (32 µg/mL-2 mg/mL) reduced the responses to KCl but the inhibitory effect was not complete and with bath concentration of 2 mg/mL the KCl response was only inhibited by 48%. Fractions Fr.1, Fr.2, Fr.3 and Fr.4 (32-500 µg/mL) were bioactive fractions and 100% inhibition of them was achieved at concentration of 500 µg/mL in the bath. Fraction 5 had no antispasmodic activity. Ritodrine (5-320 µg/mL) in a similar way
inhibited tonic contraction induced by KCl. In detail the IC₅₀ found against KCl-induced contractions were (Fr.1) 155 ± 23; (Fr.2) 197 ± 25; (Fr.3) 171 ± 35; (Fr.4) 146 ± 24 μg/mL while ritodrine were 153 ± 20 μg/mL. Fr.4 was slightly more active than others (Fig. 1). The IC₅₀ values are compared in Table 1.

**Effects on oxytocin-induced smooth muscle contraction in rat uterine**

Oxytocin (0.0005 IU/mL), caused a relatively regular rhythmic contraction on rat uterus. Fr.4 (32-1000 μg/mL), and ritodrine (5-1280 μg/mL) concentration-dependently inhibited the rhythmic contraction induced by oxytocin (Fig. 2). Antispasmodic activity of Fr.4 was comparable with ritodrine with IC₅₀ values of 130 ± 12, and 140 ± 48 μg/mL, respectively (Fig. 2). The IC₅₀ values are compared in Table 1.

**Identification of bioactive compounds**

The ethanol extract of *P. caespitosa* was chromatographed on normal silica gel column by stepwise gradient elution from hexane to ethyl acetate. Using a bioassay-directed fractionation in vitro on KCl-induced contraction in rat uterus smooth muscles, the most active fraction, Fr.4 was subjected to more purification on recycle HPLC and yielded compounds 1 and 2 as the major bioactive compounds (Fig. 3).

253
Compound 1, was obtained as a pale oil with EI-MS molecular ion at m/z 260 [M]. IR, $^{13}$C-NMR and DEPT spectra showed 17 carbons comprising of two olefin bonds including a vinyl group [$\nu_{\text{max}}$ 1647 and 987 cm$^{-1}$; $\delta$C 117.3 ($\delta$H 5.27, 1H, d, J = 10, H-1b; 5.46, 1H, d, J = 16.8, H-1a); $\delta$C 135.8 ($\delta$H 5.97, 1H, ddd, J = 5.2, 10.0, 16.8 Hz, H-2], and a disubstituted double bond [$\delta$C 134.6 ($\delta$H 8.0, 9.2, H-9), and 127.7 ($\delta$H 5.64, 1H, dt, J = 9.2, 7.2, H-10)], two disubstituted alkyne bonds [$\nu_{\text{max}}$ 2152, 2254 cm$^{-1}$; $\delta$C 68.7, 70.3, 77.3, 79.9], two hydroxymethine groups [$\nu_{\text{max}}$ 3354 cm$^{-1}$; $\delta$C 31.8, 29.3, 29.2, 29.1, 27.7, 22.6] and one methyl carbon [$\delta$C 14.1 ($\delta$H 0.90, 3H, t, J = 6.8 Hz, H-3-17)]. Application of $^1$H-$^1$H correlation spectroscopy (COSY) allowed detecting two spin systems of H-1 to H-3: CH$_2$=CH-CHOH and H-8 to H-10: CHOH-CH=CH-CH$_2$-(CH$_2$)$_5$-CH$_3$ and assigned the hydroxymethines signals at C-1 and C-9. Finally, hydroxymethine protons at $\delta$H 4.96 (1H, d, J = 11.1Hz), H-2: 6.52 (1H, dd, J = 11.1, 15.3Hz) and lack of hydroxymethine H-3 resonance (see experimental). These structural feature were similar to those of heptadeca-1,9-dien-4,6-diyne-8-ol-3-ene named as falcarindiol but with a new and more precise assignment (17).

Compound 2 was obtained as a white solid with positive reaction to methanolic ferric chloride reagent and molecular ion m/z 166 in EI-mass spectrum. $^1$H-NMR spectrum showed ABX spin pattern similar to trisubstituted vanillin derivatives at $\delta$H 7.47 (1H, d, J = 2.0 Hz, H-2), 7.47 (1H, dd, J = 8.7, 2.0 Hz, H-6), 6.88 (1H, d, J = 8.7 Hz, H-5), one methoxy at $\delta$H 3.89 (3H, s), and one downfield methyl singlet at $\delta$H 2.49 (3H, s). These data were similar to those reported for isoacetovanillone which was more confirmed by co-TLC with standard (19).

DISCUSSION

P. caespitosa extract is a relaxant of isolated uterus and in the current study we have shown that its inhibitory effect on rat uterus starts with about 256 µg/mL extract in the bath and with bath concentration of 2 mg/mL 48% of the responses to KCl was inhibited. Administration of active components rather than the total extract has two main advantages.

Firstly, the relative purity is increased and it is more feasible to give a standard dose. Secondly, administration of inactive substances is avoided.

The main objective of the present study was to isolate the active fractions of P. caespitosa extract and to compare it with the total extract. The main problem was that we had no idea about the chemical properties of the components exist in the extract. Therefore, we have used a bioassay technique based on the bioactivity properties of the separated components of P. caespitosa extract. In the initial phase of separation, we have separated inactive fractions from active fractions. Four active fractions were identified which totally inhibited the contractile response to KCl and were more potent than the total extract. Fr.4 at similar ranges of concentrations also inhibited the periodic contraction on rat uterus induced by oxytocin (Table 1).

The inhibitory concentration ranges of isolated active fraction of P. caespitosa was similar with that of ritodrine. Ritodrine by activating β2-adrenoceptor increases adenyl cyclase activity and production of intracellular cAMP which inhibits contractile proteins in smooth muscles (21).
As Fr.4 was slightly more active than other fractions and therefore, subjected to further separation and identification of its components using HPLC analysis. Falcarindiol and isooacetovanillone were identified as main constituents. In addition two minor constituents with acetylene structures existed which were not identified. Isoacetovanillone is also identified as one of the active component of *P. spinosa* extract and has been reported to have relaxant effect on ileum contractions (21). In another study by Matsuda, *et al.* in a model of norepinephrine and KCl-induced contractions on isolated thoracic aorta of rats, falcarindiol isolated from *Angelica furcijunga* (Umbelliferae) nonselectively inhibited both contractions (22).

**CONCLUSION**

In this research bioactivity guided technique was successively used for separation of active fraction of *P. caespitosa*. The more active fraction inhibited both tonic and rhythmic contractile responses in rat isolated uterus. Falcarindiol and isooacetovanillone are two component which were identified in the active fraction. Therefore, further research on these two component are suggested.
